

# **SANDIA REPORT**

SAND2004-3894  
Unlimited Release  
Printed August 2004

## **The SANDmath Package**

**Philippe P. Pébay**

Prepared by  
Sandia National Laboratories  
Albuquerque, New Mexico 87185 and Livermore, California 94550

Sandia is a multiprogram laboratory operated by Sandia Corporation,  
a Lockheed Martin Company, for the United States Department of Energy's  
National Nuclear Security Administration under Contract DE-AC04-94-AL85000.

Approved for public release; further dissemination unlimited.

**Sandia National Laboratories**

Issued by Sandia National Laboratories, operated for the United States Department of Energy by Sandia Corporation.

**NOTICE:** This report was prepared as an account of work sponsored by an agency of the United States Government. Neither the United States Government, nor any agency thereof, nor any of their employees, nor any of their contractors, subcontractors, or their employees, make any warranty, express or implied, or assume any legal liability or responsibility for the accuracy, completeness, or usefulness of any information, apparatus, product, or process disclosed, or represent that its use would not infringe privately owned rights. Reference herein to any specific commercial product, process, or service by trade name, trademark, manufacturer, or otherwise, does not necessarily constitute or imply its endorsement, recommendation, or favoring by the United States Government, any agency thereof, or any of their contractors or subcontractors. The views and opinions expressed herein do not necessarily state or reflect those of the United States Government, any agency thereof, or any of their contractors.

Printed in the United States of America. This report has been reproduced directly from the best available copy.

Available to DOE and DOE contractors from  
U.S. Department of Energy  
Office of Scientific and Technical Information  
P.O. Box 62  
Oak Ridge, TN 37831

Telephone: (865) 576-8401

### **Abstract**

This is a basic documentation explaining how to use the SANDmath macros with a  $\text{\LaTeX}$  2 $\epsilon$  document pertaining to the SANDreport class.

# The SANDmath Package

## 1 Introduction

### 1.1 What It Is

The file `SANDmath.tex` is a  $\text{\LaTeX 2}_{\epsilon}$  file, to be used optionally with the `SANDreport.cls`  $\text{\LaTeX}$  class file [1]. It provides:

- a set of mathematical environments, standardized for the use in the context of Sandia technical reports;
- a large number of mathematical macros.

This file is available for download at the following URL:

<http://www.cs.sandia.gov/~rolf/SANDreport/sandDownload.html>

### 1.2 How to Use It

`SANDmath` shall be inserted in the document preamble, *e.g.*, as follows:

```
\documentclass[options]{SANDreport}  
\input{SANDmath}
```

## 2 Mathematical Environments

The following environments are predefined in `SANDmath`: `theo`, `prop`, `lemm`, `coro`, `defi`, `axio`, `rema`, `exam`, and `algo`. In addition, the standard proof environment can be used. Their are index with the form *m.n*, where *m* is the current section index.

Also note that the standard equation can obviously be used, with its counter being sub-indexed from the current section number:

|                                     |                 |       |
|-------------------------------------|-----------------|-------|
| <code>\begin{equation}</code>       |                 |       |
| <code>\mbox{first equation}</code>  | first equation  | (2.1) |
| <code>\end{equation}</code>         |                 |       |
| <code>\begin{equation}</code>       |                 |       |
| <code>\mbox{second equation}</code> | second equation | (2.2) |
| <code>\end{equation}</code>         |                 |       |

### 2.1 Theorem-like Environments

Theorem-like environments are `theo`, `prop`, `lemm` and `coro`. They use the same *n* sub-counter, as follows:

|  |   |
|--|---|
| <code>\begin{theo}[Rule]</code>        |   |
| This is a theorem \dots                | <b>Theorem 2.1 (Rule).</b> <i>This is a theorem ...</i>                         |
| <code>\end{theo}</code>                |   |
| <code>\begin{proof}</code>             |   |
| \dots along with its proof \dots       | <i>Proof.</i> ... along with its proof ... <span style="float: right;">□</span> |
| <code>\end{proof}</code>               |   |
| <code>\begin{coro}[Consequence]</code> |   |
| \dots and a subsequent corollary.      | <b>Corollary 2.2 (Consequence).</b> ... and a subsequent corollary.             |
| <code>\end{coro}</code>                |   |

Please note that the subcounter increases, notwithstanding whether a `theo`, `prop`, `lemm`, or `coro` environment is used.

|   |  |
|---|--|
| <code>\begin{lemm}[Lemma A]</code>        |  |
| This is a lemma.                          | <b>Lemma 2.3 (Lemma A).</b> <i>This is a lemma.</i>                    |
| <code>\end{lemm}</code>                   |  |
| <code>\begin{prop}[Proposition 13]</code> |  |
| This is a proposition.                    | <b>Proposition 2.4 (Proposition 13).</b> <i>This is a proposition.</i> |
| <code>\end{prop}</code>                   |  |

### 2.2 Definition-like Environments

Definition-like environments are `defi` and `axio`. They each have their own subcounter *n*:

```

\begin{defi}[Name]
This is a definition.
\end{defi}
\begin{axio}[Name]
This is an axiom.
\end{axio}

```

**Definition 2.1 (Name).** This is a definition.

**Axiom 2.1 (Name).** This is an axiom.

## 2.3 Remark-like Environments

Remark-like environments are `rema` and `exam`. They also each have their own subcounter  $n$ :

```

\begin{rema}[Name]
This is a remark.
\end{rema}
\begin{exam}[Name]
This is an example.
\end{exam}

```

*Remark 2.1 (Name).* This is a remark.

*Example 2.1 (Name).* This is an example.

## 2.4 The Algorithm Environment

Finally, a specific algorithm environment is offered:

```

\begin{algo}[Name]
\hfill
\begin{itemize}
\item this is an algorithm
\item while ( condition ), do:
\begin{itemize}
\item and this is
\item a conditional loop
\end{itemize}
\end{itemize}
\end{algo}

```

**Algorithm 2.1 [Name]**

- this is an algorithm
- while ( condition ), do:
  - and this is
  - a conditional loop

## 3 Mathematical Macros

### 3.1 Fields

The following enhanced “blackboard font” field letters are made available, since `\mathbb{}` is not really satisfactory:

`\K \quad \N \quad \Z \quad \R \quad \C`

|              |              |              |              |              |
|--------------|--------------|--------------|--------------|--------------|
| $\mathbb{K}$ | $\mathbb{N}$ | $\mathbb{Z}$ | $\mathbb{R}$ | $\mathbb{C}$ |
|--------------|--------------|--------------|--------------|--------------|

### 3.2 Functional Spaces

SANDmath also provides some classical functional spaces:

`\CC{1} \quad \CCs{\infty}{0} \quad \Lo \quad \Lt \quad \Li \quad \Lsp{p}`

|                 |                        |       |       |            |       |
|-----------------|------------------------|-------|-------|------------|-------|
| $\mathcal{C}^1$ | $\mathcal{C}_0^\infty$ | $L^1$ | $L^2$ | $L^\infty$ | $L^p$ |
|-----------------|------------------------|-------|-------|------------|-------|

One can also specify the domain of the space, *e.g.*,

`\CC{1}([a,b]) \quad \Lt(\Omega)`

|                        |               |
|------------------------|---------------|
| $\mathcal{C}^1([a,b])$ | $L^2(\Omega)$ |
|------------------------|---------------|

### 3.3 Differential Calculus

The package makes available a variety of differential calcul unary, binary and ternary operators. Please note that the differential *d* symbol is in straight font, as it *should* be. First, derivative operators:

`\displaystyle \dd{x}`  
`\quad \der{f}{x}`  
`\quad \lder{f}{x}`  
`\quad \dern{n}{f}{x}`  
`\quad \ldern{n}{f}{x}`

|      |                 |                 |                      |                     |
|------|-----------------|-----------------|----------------------|---------------------|
| $dx$ | $\frac{df}{dx}$ | $\frac{d}{dx}f$ | $\frac{d^n f}{dx^n}$ | $\frac{d^n}{dx^n}f$ |
|------|-----------------|-----------------|----------------------|---------------------|

Second, partial derivative operators:

`\displaystyle \pder{f}{x}`  
`\quad \lpder{f}{x}`  
`\quad \pdern{n}{f}{x}`  
`\quad \lpdern{n}{f}{x}`  
`\quad \pxder{f}{x}{y}`  
`\quad \lpxder{f}{x}{y}`

|                                 |                                |                                     |                                    |  |   |
|---------------------------------|--------------------------------|-------------------------------------|------------------------------------|--|---|
| $\frac{\partial f}{\partial x}$ | $\frac{\partial}{\partial x}f$ | $\frac{\partial^n f}{\partial x^n}$ | $\frac{\partial^n}{\partial x^n}f$ | $\frac{\partial^2 f}{\partial x \partial y}$ | $\frac{\partial^2}{\partial x \partial y}f$ |
|---------------------------------|--------------------------------|-------------------------------------|------------------------------------|--|---|

SANDmath also defines the divergence, gradient and curl operators, both in long:

$\operatorname{div} f \quad \operatorname{grad} f \quad \operatorname{curl} f$

[illegible]

$\nabla \cdot f$     $\nabla f$     $\nabla \times f$

SANDmath also provides a collection of simple:

$$\int_a^b f(x) \, dx$$
$$\int \int \int_U f(x,y) \, dx \, dy \, dz$$
$$\iint_U f(u) \, du \quad \iint_U f(x, y) \, dx dy$$
$$\text{\tt $\displaystyle \tint{V}{f(v)}{v} \quad \ttint{V}{f(x,y,z)}{x}{y}{z}$}$$
$$\iiint_V f(v) \, dv \quad \iiint_V f(x, y, z) \, dx dy dz$$

First, various usual norms:

$$\|u\| \quad \|u\|_1 \quad \|u\|_2 \quad \|u\|_\infty \quad \|u\|_{0,\Omega}$$

|           |           |
|-----------|-----------|
| $\ u\ _0$ | $\ u\ _0$ |
| $\ u\ _1$ | $\ u\ _1$ |
| $\ u\ _2$ | $\ u\ _2$ |
| $\ u\ _p$ | $\ u\ _p$ |

$\|u\|_{L^1} \quad \|u\|_{L^2} \quad \|u\|_{L^\infty} \quad \|u\|_{L^p}$

**More esoteric unary norm-like operators (seminorms, induced norms):**

`\displaystyle \seminorm{1,\Omega}{u}`  
`\quad \quad \quad \indnorm{u}`

$$|u|_{1,\Omega} \quad |||u|||$$

Finally, some binary and ternary vector operators:

`\displaystyle \innprod{u}{v}`  
`\quad \quad \quad \dualpair{u}{v}`  
`\quad \quad \quad \mixprod{u}{v}{w}`

$$(u|v) \quad \langle u, v \rangle \quad [u, v, w]$$

### 3.6 Asymptotic Notations

The package provides in particular short-hand notations for the LANDAU notations (“small-o” and “big-o”), with what I think is the correct font family: straight and not slanted.

`\displaystyle \smallo{\normtwo{f}}`  
`\quad \quad \quad \bigo{h^n}`  
`\quad \quad \quad f(x) \aseq{x}{0} g(x)`

$$o(\|f\|_2) \quad O(h^n) \quad f(x) \underset{x \rightarrow 0}{\sim} g(x)$$

## 4 Brief Concluding Remarks

The SANDmath package is *not* intended to be frozen in its current state; comments and suggestions to improve it are more than welcome.

In particular, the choices made to define the mathematical environments in the current version of SANDmath *de facto* define a standard mathematical style for SAND reports. However, these style choices do not reflect any existing style policy, since there is not, to my knowledge, any such policy. Therefore, any SANDmath user willing to discuss the choices I made is strongly encouraged to do so.
